Taxonomy, phylogeny and biogeography of the ant genus *Tetraponera* (Hymenoptera : Formicidae) in the Oriental and Australian regions

Philip S. Ward

Department of Entomology, University of California, Davis, CA 95616, USA. Email: psward@ucdavis.edu

Abstract

A revision of the ant genus *Tetraponera* in the Oriental and Australian regions reveals 33 species (18 new), belonging to four informal species-groups: *allaborans*-group (*T. allaborans* (Walker), *T. apiculata*, sp. nov., *T. avia*, sp. nov., *T. bita*, sp. nov., *T. brevis*, sp. nov., *T. conica*, sp. nov., *T. connectens*, sp. nov., *T. crassiuscula* (Emery) stat. nov., *T. extenuata*, sp. nov., *T. microcarpa* Wu & Wang and *T. modesta* (F. Smith)); *nigra*-group (*T. aitkenii* (Forel), *T. atra* Donisthorpe, *T. attenuata* F. Smith, *T. binghami* (Forel), *T. buops*, sp. nov., *T. difficilis* (Emery), *T. inversinodis*, sp. nov., *T. laeviceps* (F. Smith), *T. mimula*, sp. nov., *T. nigra* (Jerdon), *T. nitida* (F. Smith), *T. nixa*, sp. nov., *T. nodosa*, sp. nov., *T. notabilis*, sp. nov., *T. polita*, sp. nov., *T. punctulata* F. Smith, *T. rotula*, sp. nov., *T. tucurua*, sp. nov., *vivax*, sp. nov. and *T. volucris*, sp. nov.); *pilosa*-group (*T. pilosa* (F. Smith)); and *rufonigra*-group (*T. rufonigra* (Jerdon)). Keys are provided for identification of workers, queens and males, although the sexual forms remain unknown in some species. Phylogenetic analysis indicates that the four species-groups represent independent lineages, each with its nearest extant relatives in the Afrotropical region. There have been multiple invasions of Asia from Africa, and at least four west-to-east transgressions of Wallace's line into the Australian region. Plate tectonic events postulated to have been important in facilitating such dispersal include the collision of India with Asia in the Eocene and the approach of the Australian plate to Laurasia in the mid-Miocene.

Introduction

This accessory publication supplements the recent revision (Ward 2001) of the ant genus *Tetraponera* in the Oriental and Australian regions. In that paper the collection records for each species were abbreviated to locality and collector, with the collection depositories given at the end of each list of 'Material examined'. Here the specimen data are presented in greater detail, in tabular format. For each collection record, up to twelve fields of information are employed: Species Group, Species, Identification (ID), Country, Admin1, Locality, Collector, Specimens, Notes, Coordinates, Source (SO), and Collection.

Explanation of fields

Species Group and Species. The names of the *Tetraponera* species-groups and species are those used in Ward (2001).

Identification (ID). A question mark ('?') in the Identification (ID) column signifies uncertainty about species identification. Such records correspond to the cases in Ward (2001) where specimens were 'provisionally' identified as belonging to a particular species.

Country. Country names are represented by a two-letter code. These correspond to the abbreviations used by the United States' National Imagery and Mapping Agency (NIMA) on its GEOnet Names Server (<http://164.214.2.59/gns/html/index.html>).

Admin1. This refers to the primary administrative divisions within each country. For Australia these have been abbreviated as follows: NSW, New South Wales; NT, Northern Territory; Qld, Queensland; SA, South Australia; and WA, Western Australia. Administrative divisions are omitted for Brunei, Bhutan, Singapore and the Seychelles.

Locality. Locality names are taken from the specimen label. In the case of archaic, misspelled, or abbreviated names the entry is usually modified, with the accepted name cited first followed by the name appearing on the specimen label (e.g. Jakarta [as 'Batavia']).

Collector. The collector name is given in the form <last name >, <initials >. If there are two collectors the names are separated by a semicolon. If there are three or more collectors, then only the first collector is cited, followed by 'et al.'. The expression 'c.u.' signifies that the collector could not be determined.

Specimens. In this field are listed the numbers and kinds of specimens, using the following notations: w, worker; aq, alate queen; dq, dealate queen; and m, male. This information is not available for all records.

Notes. This field contains a miscellaneous assortment of information including date(s) of collection, habitat, and specimen measurements. This information was not uniformly recorded for all specimens. The abbreviations for measurements, indices and setal counts (HW, HL, CI, PLI, MSC, etc.) are explained in Ward (2001).

Coordinates. The estimated coordinates of the collection site are given as latitude and longitude in degrees and minutes. This was determined using maps, gazetteers, and other sources (see Ward 2001).

Source (SO). When the latitude and longitude were taken directly from the specimen label this is indicated by an 'L' in the SO column. A 'C' in the SO column indicates uncertainty in the estimate of latitude and longitude.

Collection. This indicates the collection in which the specimens were examined or deposited. The four-letter abbreviations for depositories are those listed in Ward (2001).
