Little; Cinnamon Bushlark; the following Finches:—Red-eared Firetail, Painted, Black-ringed, Yellow-tailed, Pictorella, Blue-faced, Crimson, Pale-crimson, Black-tailed, Masked; Tooth-billed Bower-bird, all Bower-birds of the genus *Chlamydera*; Magnificent Rifle-Bird; Little Crow; Grey, Brown, and Clinking Currawongs; all Butcher-birds except the Grey; Western and Black-backed Magnies.

Migrants and Others

By H. STUART DOVE, R.A.O.U., Tas.

It is gratifying to record that a pair of Magpie-Larks (Grallina cyanoleuca) has been about the Devonport district for several weeks, and we hope that these elegant and useful birds will make their home here. About thirty years ago there was a small colony of Grallinas on Mr. Archer's estate near Longford; they nested there, but whether any members of that colony still survive I cannot say. The Devonport pair probably came across from Victoria (or from King Island, if the species occurs there) on the wings of one of the strong north-westers we have had.

At the end of January this year a Fantailed Cuckoo (Cacomantis flabelliformis) was trilling in a white-gum tree at the Mersey Bluff, and a Palid Cuckoo (Cuculus pallidus) was calling on the Don Road at 5.30 a.m.; neither had been heard for several weeks previously. On 6th March a Fantailed Cuckoo was heard both trilling and whistling in a eucalypt near the cottage; and through almost the whole of May birds of this species which winter with us were uttering the trill call.

Small parties of Spine-tailed Swifts (Hirundapus caudacutus) were observed on 14th and 15th March in late afternoon making towards the north-west, evidently about to cross Bass Strait. At the end of March Welcome Swallows (Hirundo neoxena) left, except the pair which winters under a town verandah; Pipits (Anthus australis) and adult Cuckoos (except the few resident individuals) went at the same period. On 1st April a number of Dusky Wood-Swallows (Artamus cyanopterus) were sitting about the fences of the Parade (Mersey Estuary), evidently preparing to depart, but by the middle of the month many were gathered on fences about a mile inland, between Don and Forth, so this species evidently leaves in batches, instead of clearing out suddenly, like Pipits and Welcome Swallows.

No Black-faced Cuckoo-Shrikes or Summer-Birds (*Coracina novæ-hollandiæ*) were seen after the end of March. Usually I have seen small parties during April, moving gradually towards the north-west, and feeding in the eucalypts as they make their autumn trek, but this elegant species has been scarcer on the coast this season.
