Arctic Tern: second Victorian record.—On October 1, 1960, a well-weathered skeleton of a tern was picked up on Somers Beach. It was subsequently identified by A. R. McEvey as an Arctic Tern, *Sterna macrura*, and was sent to K. A. Hindwood for confirmation. Hindwood supported McEvey's conclusion and the bird is registered B 7380 in the National Museum of Victoria. This constitutes a second record for Victoria. The first was found dead on a hill overlooking Lake Purrumbete, near Camperdown, on December 13, 1953 (Morgan, *Emu* 54: 58-9, 1954).

The measurements in millimetres are as follows:

McEvey:

Culmen (estimated) 33
Right wing 262
Tarsus (maximum) 16

Hindwood:

Culmen 32.5
Right wing 262
Tarsus 15.5-16
