Table S1. Morphological and ecophysiological traits with significant differences among three tepal whorls or four leaf growth stages of M. denudata and M. soulangeana
Data are mean $\pm$ s.e.m. Sample sizes ( $n$ ) are given in brackets after each value; results of multiple comparisons are reported.
Abbreviations are the same as in Table 1

|  | Flower whorl | Leaf stage | Magnolia denudata |  | Magnolia soulangeana |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Flower ( $n$ ) | Leaf ( $n$ ) | Flower ( $n$ ) | Leaf ( $n$ ) |

Fig. S1. $J_{S}$ of (a) flowers and (b) leaves measured during two sunny days during flowering and vegetative periods for M. denudata and $M$. soulangeana. Since $D$ in leaf period overlapped with the whole range of $D$ during the flowering period (Fig. 2a), (c) predicted $J_{\text {s }}$ of leaves during flowering period were calculated based on the relationships between $J_{\mathrm{S}}$ and $D$ in two light levels (Fig. 4c d) and the $D$ values on Feb-24.

Fig. S2. Flower and leaf areas ( $S$ ) versus stem diameters (d) for M. denudata (close symbols) and M. soulangeana (open symbols). (a) Total flower (triangles) or leaf (circles) areas for each of the 16 branches with sap flow monitoring ( $n=6$ for M. denudata and 10 for $M$. soulangeana). Flower areas on each branch are calculated as mean single flower area $\times$ total flower numbers, while leaf areas on each branch are predicted by models in (b) and (c). (b) Leaf area for larger branches ( $d=2 \sim 40 \mathrm{~mm}, n=35$ for $M$. denudata and 44
for $M$. soulangeana) based on diameters of all the smaller branches ( $d<10 \mathrm{~mm}$ ) on each branch, and (c) carefully measured leaf areas on small branches ( $d<10 \mathrm{~mm}$ ). Relationships are: (a) M. soulangeana leaf, $S=0.0016 \times d^{2.3085}\left(\mathrm{R}^{2}=0.99^{* * *}\right)$; M. denudata leaf, $S=0.0021 \times d^{2.0818}\left(\mathrm{R}^{2}=0.99^{* * *}\right) ; \quad$. soulangeana flower, $S=0.0001 \times d^{2.5765}$ $\left(\mathrm{R}^{2}=0.96^{* * *}\right)$; M. denudata flower, $S=0.0061 \times d^{1.386}\left(\mathrm{R}^{2}=0.98^{* * *}\right)$; (b) M. soulangeana leaf, $S=0.0014 \times d^{2.3563}\left(\mathrm{R}^{2}=0.97^{* * *}\right) ;$. denudata leaf, $S=0.0028 \times d^{1.9781}\left(\mathrm{R}^{2}=0.96^{* * *}\right)$; and (c) M. soulangeana leaf, $S=0.0376 \times d-0.923\left(\mathrm{R}^{2}=0.89^{* * *}\right) ;$. denudata leaf, $S=0.0417 \times d-$ $0.1151\left(\mathrm{R}^{2}=0.96^{* * *}\right)$.

Fig. S3. Daily changes in flower and leaf stomatal conductance ( $g_{s}$ ) of M. denudata and M. soulangeana during two sunny days. Flowers of (a) M. denudata and (b) M. soulangeana have tepals in three whorls ( $1^{\text {st }}$ outer whorl, black; $2^{\text {nd }}$ middle whorl, grey; $3^{\text {rd }}$ inner whorl, white), and are divided into fully-open (bars without dashes) and halfopen (bars with dashes, bars with higher values are put as the background) groups. Leaves of (c) M. denudata and (d) M. soulangeana are divided into four growth stages in each cluster ( $1^{\text {st }}$ half-expanded leaves: closed circles; $2^{\text {nd }}$ fully-expanded leaves: closed triangles; $3^{\text {rd }}$ mature leaves: closed square; $4^{\text {th }}$ small basal leaves: open circles). In (a) and (b), italic letters on the top of each bar indicate the multiple comparison results among three whorls in half-open flowers, while regular letters at the bottom of each bar indicate comparisons in fully-open flowers; in (c) and (d), results of statistical analysis using ANOVA on leaf growth stages are labelled ( $* * *, P<0.001$ ).

Fig. S4. Daily changes in flower and leaf water potential $(\Psi)$ of $M$. denudata and $M$. soulangeana during two sunny days. Colours and symbols for different flower whorls, fully-open and half-open flowers, and leaf growth stages are the same as in Fig. S3. In (a) and (b), bars with higher values are put as the background, with italic letters on the top of each bar indicate the multiple comparison results among three whorls in half-open flowers, while regular letters at the bottom of each bar indicate comparisons in fully-open flowers; in (c) and (d), results of statistical analysis using ANOVA on leaf growth stages are labelled (ns, $P>0.05$ ). Red lines indicate mean $\Psi_{\text {tlp }}$ (dashed red lines are minimum and maximum $\Psi_{\text {tlp }}$ values among tepal whorls or leaf growth stages). The differences between minimum $\Psi$ and $\Psi_{\mathrm{tlp}}$ are hydraulic safety margins.
