20 Table 2. Calibration and validation model parameters and statistics derived for predicting OC, POC,
 21 HOC and ROC contents of the 312 fractionated soils using the following modelling approaches: 1)
 22 random cross validation, 2) full cross validation, 3) test set validation using samples selected from a
 23 PCA analysis of spectra, and 4) test set validation using samples selected from a PLSR analysis. For
 24 the random cross validation approach 20 segments containing 15 or 16 samples were used. The full
 25 cross validation used a leave one out approach incorporating all 312 samples. For the two test set
 26 validation approaches the optimum 250 samples, as identified using a Kennard-Stone algorithm,
 27 were used for calibration and the remaining 62 samples were used for validation.
