**General Experimental Methods.** THF was heated at reflux over sodium benzophenone ketyl before use. All reactions were carried out under N<sub>2</sub> atmosphere using oven dried glassware. NMR spectra were recorded with Bruker Advance II at 400 MHz for <sup>1</sup>H ,100 MHz for <sup>13</sup>C NMR , 396 MHz for <sup>19</sup>F NMR, and chemical shifts are given in parts per million. LC-MS (ESI-API) analyses was carried out with an Agilent 1100 LC/MSD Trap mass spectrometer. GC-MS(EI) analyses was carried out with a Thermo Fisher DSQ apparatus (70 eV) with ions given in m/z, High-resolution mass spectra were recorded on an IT-TOF of Shimadzu mass spectrometer.

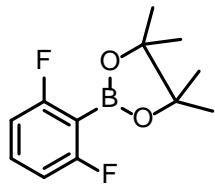

**General procedure for metalation-boronation of 1,3-disubstituted benzene:**

**Method A:** To an oven-dried 100 mL flask was added 1,3-disubstituted benzene (3.0 mmol), TMEDA (1.1 equiv., 3.3 mmol), DIPA (5% equiv., 0.16 mmol) and THF (10.0 mL). The solution was cooled to -78 °C for 10 min and then *n*-BuLi (1.1 equiv., 3.3 mmol) was added dropwise. The mixture was kept at this temperature for 1.5 hour; B<sub>2</sub>Pin<sub>2</sub> (1.5 equiv., 4.5 mmol) was added and the mixture was further stirred for another half an hour at -78 °C. The mixture was allowed to warm up to room temperature for 1-12 h, followed by the addition of saturated NH<sub>4</sub>Cl-H<sub>2</sub>O solution (5 mL); extraction three times with ethyl acetate (10 mL×3). The combined organic layers were dried over anhydrous MgSO<sub>4</sub>, filtered, and concentrated in vacuo. The regioselectivity of the crude product was confirmed by <sup>19</sup>F NMR or by LC/MS and then subjected to flash chromatography to obtain the desired products which were characterized by <sup>1</sup>H NMR, <sup>19</sup>F NMR ,<sup>13</sup>C NMR spectral data and LC/MS analyses.

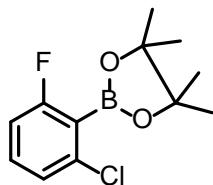

**Method B:**

Similar to method A, the electrophilic reagent was changed to *i*-PrOBPin . The mixture was dealt with the same as in method A.
