## Supplementary material

**Fig. S1.** Scheme of the experiment: The gray bar represents the control treatment, the purple bar indicates the short submergence treatment of 5 days, and the green bar indicates the long submergence treatment of 10 days. The black arrows denote the initial harvests before the submergence treatments on day 0 and day 5. The white arrows indicate the harvest times for all three treatments: on the day of submergence (day 10) and at the end of the experiment (day 28) to analyze recovery. The striped-purple bar in the short submergence treatment of 5 days indicates that the plants were not submerged until day 5. An additional harvest was carried out on day 5 to obtain initial (control) values for that treatment. Then, the 5-day treatment was applied until day 10, when harvests for all treatments were conducted. This protocol allowed the desubmergence of plants on the same day, ensuring recovery under the same environmental conditions.

**Table S1.** Mean dry biomass values (bold font, in g per plant) and their standard errors for the compartments of leaves, stems/stolons, crowns and roots for (a) desubmergence and (b) recovery for species of *Lotus* and *Trifolium*, separated into the 3 treatments of control, short submergence of 5 days, and long submergence of 10 days.
