Supplementary Material

Fig. S1 (a). Conceptual layout of a block, plots (50×50 m) within blocks, and quadrats (2×2 m) within plots for fire 1. There were $n = 3$ grassy blocks, and $n = 1$ woodland block for fire 1 (Fig. S3). Within blocks there were $n = 5$ burnt plots and $n = 5$ unburnt plots. Vegetation sampling was by $n = 4$ quadrats (2×2 m) per plot. (b) Conceptual layout of a block (large square) and plots within blocks for fire 2. There were $n = 3$ grassy blocks for fire 2 (Fig. S3). Within blocks there were $n = 3$ spring burnt plots and $n = 3$ spring unburnt plots (autumn plots not shown). Vegetation sampling was by 4 quadrats (2×2 m) per plot.

(a)

Fire 1

(b)

Fire 2

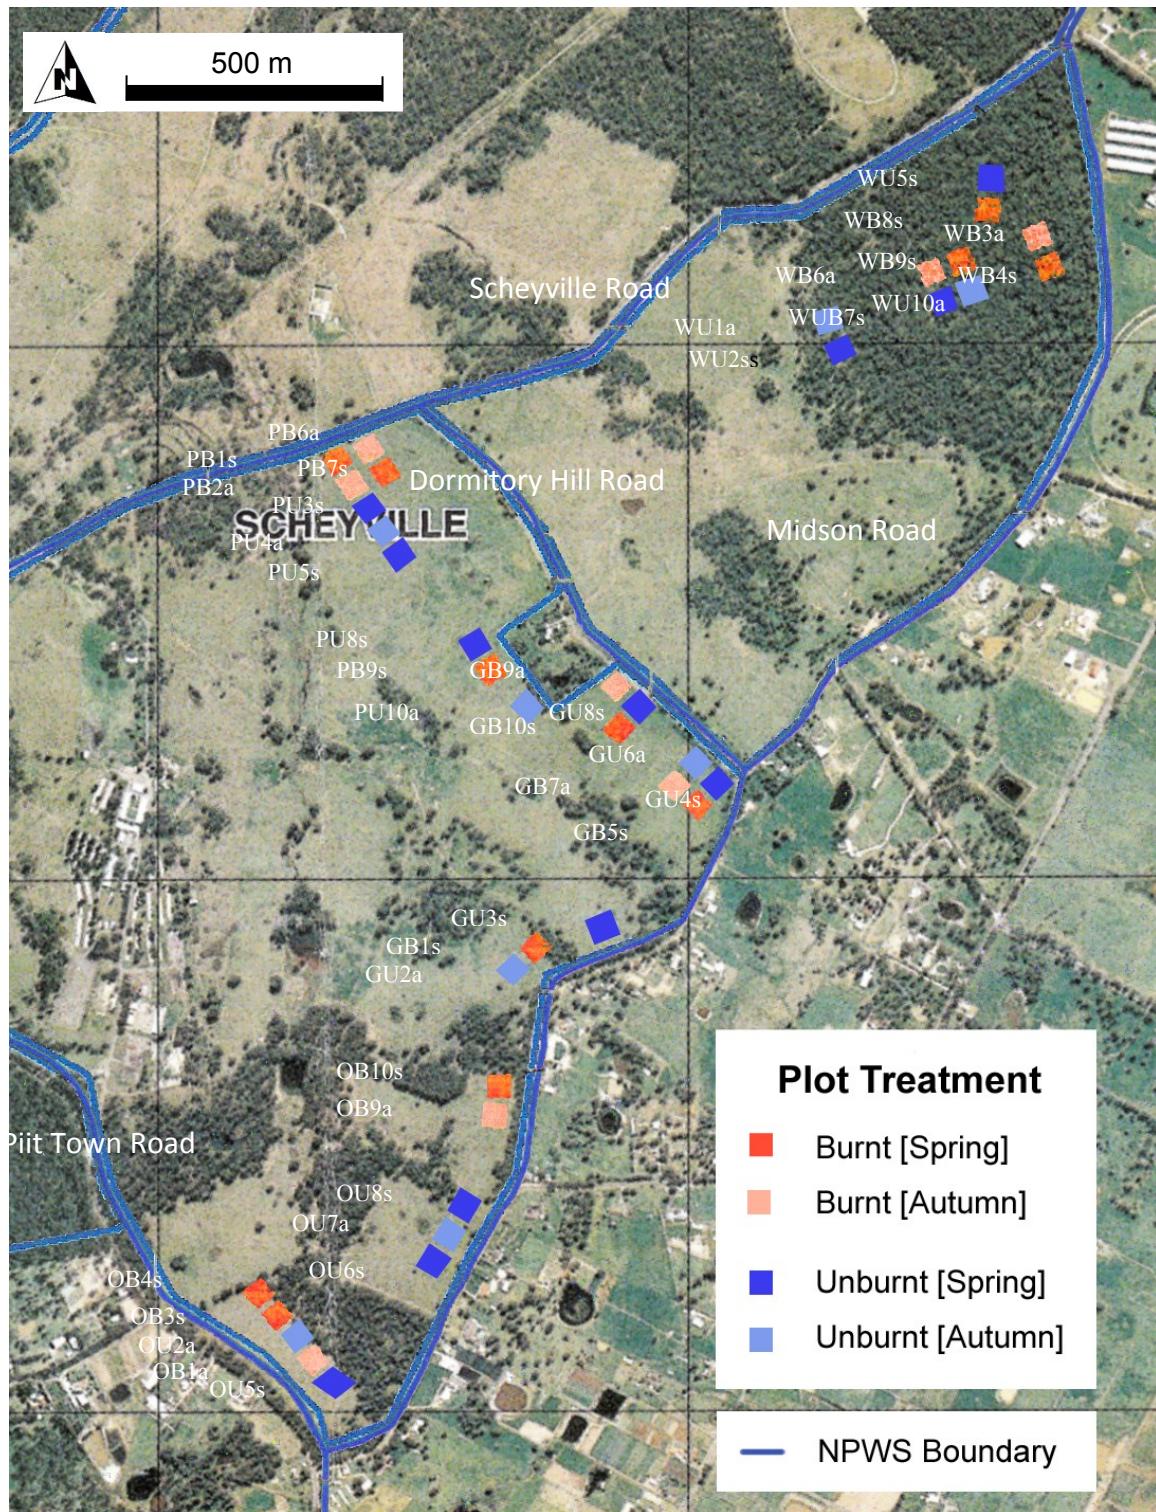

Fig. S2. Scheyville Fire Experiment. Layout of blocks and plots within blocks in Scheyville National Park.

1st letter = grassy block (P= ploughed, G = grazed, O = orchard) or woodland (W = woodland).

2nd letter = fire treatment (B = burnt, U = unburnt). Number = plot number within block.

Spring and autumn burnt and unburnt plots shown by colour code.

Table S1. Timing of fire events and field survey work throughout the experimental period.

Number of plots per treatment x block combination given in parentheses.

Year	Month	All plots ($n = 5$)
2001	June	Pre-fire 1 survey
	November	Fire 1
2002	June/ July	Post-fire 1 survey
		Spring burn plots ($n = 3$) Autumn burn plots ($n = 2$)
2005	March/ April	Pre-fire 2 survey
	Aug/ Sept	Pre-fire 2 survey
	Sept/ Oct	Fire 2 (excluding woodland)
2006	April	Post-fire 2 survey
	September	Spring Wildfire Spring Wildfire
2012	December	All plots on grassy blocks surveyed

Table S2. List of native and exotic species found on the grassy blocks over all surveys.

Species sorted by growth form, then species. Fire response shown where known (seeder = S, resprouter = R, mixed seeder or resprouter = RS, Rs, or Sr; NSW Flora Fire Response Database (Office of Environment and Heritage 2010). Life history shown (annual, perennial, or mixed annual/perennial plus biennials (ann/peren) (Harden 1990 – 1993). Species characteristic of Cumberland Plain Woodland are coded in green (NSW Threatened Species Scientific Committee 2009. Sum of cover scores (per 4 m²) over both fire treatments and all four surveys is shown as an indicator of overall abundance.

Table S4. Life history categories of native and exotic forbs and grasses in the grassy areas, and the woodland.

Life histories were categorised as annual, annual/perennial (biennials included), or perennial. For some species, life history information was unknown. Percentage in brackets after each value is the percentage of that category calculated using the total known species as the denominator.

Grassy blocks	Native Forbs	Native Grasses	Exotic forbs	Exotic grasses
Annual	2 (6%)	1 (5%)	11 (35%)	1 (7%)
Annual/perennial	4 (12.5%)	1 (5%)	5 (16%)	2 (14%)
Perennial	26 (81%)	19 (90%)	15 (48%)	11 (79%)
Total known	32	21	31	14
Unknown	3	4	6	1
Total	35	25	37	15
Woodland				
Annual	2 (6%)	0	7 (50%)	0
Annual/perennial	7 (20%)	1 (5%)	2 (14%)	0
Perennial	26 (74%)	18 (95%)	5 (36%)	9 (100%)
Total known	35	19	14	9
Unknown	5	2	4	0
Total	40	21	18	9

Table S5. Species contributing to dissimilarity between burnt and unburnt grassy plots, post-fire 1 survey.

Species ranked by contribution to cumulative dissimilarity. Life form, average abundance (Av.Ab., 4th square root) in the burnt and unburnt treatments, percentage contribution (Contrib%) and cumulative contribution to dissimilarity (Cum.%) are shown for each species. Life form, life history and fire response strategy shown for forbs only where known (S = seeder; R = resprouter; Sr = mixed response; NSW Flora Fire Response Database (Office of Environment and Heritage 2010). Exotic forbs coded in grey have the S fire response.

Species	Life Form	Life history	Fire Response	Burnt Av. Abund.	Unburnt Av. Abund.	Contrib%	Cum.%

Table S6. Species contributing to dissimilarity between burnt and unburnt grassy plots, pre-fire 2 survey.

Species ranked by contribution to cumulative dissimilarity. Life form, average abundance (Av. Abund., 4th square root) in the burnt and unburnt treatments, percentage contribution (Contrib%) and cumulative contribution to dissimilarity (Cum.%) are shown for each species. Life form, life history and fire response strategy shown for forbs only where known (S = seeder; R= resprouter; Rs, Sr = mixed response; NSW Flora Fire Response Database (Office of Environment and Heritage 2010). Exotic forbs coded in grey have the S fire response.

	Life Form	Life history	Fire Response	Burnt Av. Abund.	Unburnt Av. Abund.	Contrib%	Cum.%

Table 8. Native species detected only in the burnt treatment on the grassy blocks from post-fire 1 survey onwards.

Category 1 species were only ever detected in the burnt treatment after fire. Category 2 species were detected on unburnt and (to be) burnt plots at pre-fire 1 survey, and only on burnt plots from post-fire 1 onwards. Species sorted by life form and then by species. Data are mean abundance score (4th square root) per survey.

Category 1		Pre-fire 1		Post-fire 1		Pre-fire 2		Post-fire 2	
	Life form	Burnt	Unburnt	Burnt	Unburnt	Burnt	Unburnt	Burnt	Unburnt
<i>Einadia hastata</i>	forb							0.09	
<i>Lachnagrostis filiformis</i>	grass							0.2	
<i>Bothriocloa decipiens</i>	grass							0.08
