Post-stack 3D merging to fast-track regional interpretation

Offshore Otway Basin case study

Setting

- Multiple surveys, orientation, imaging, previous merges.
- Regional – predominantly 2D - mapping project

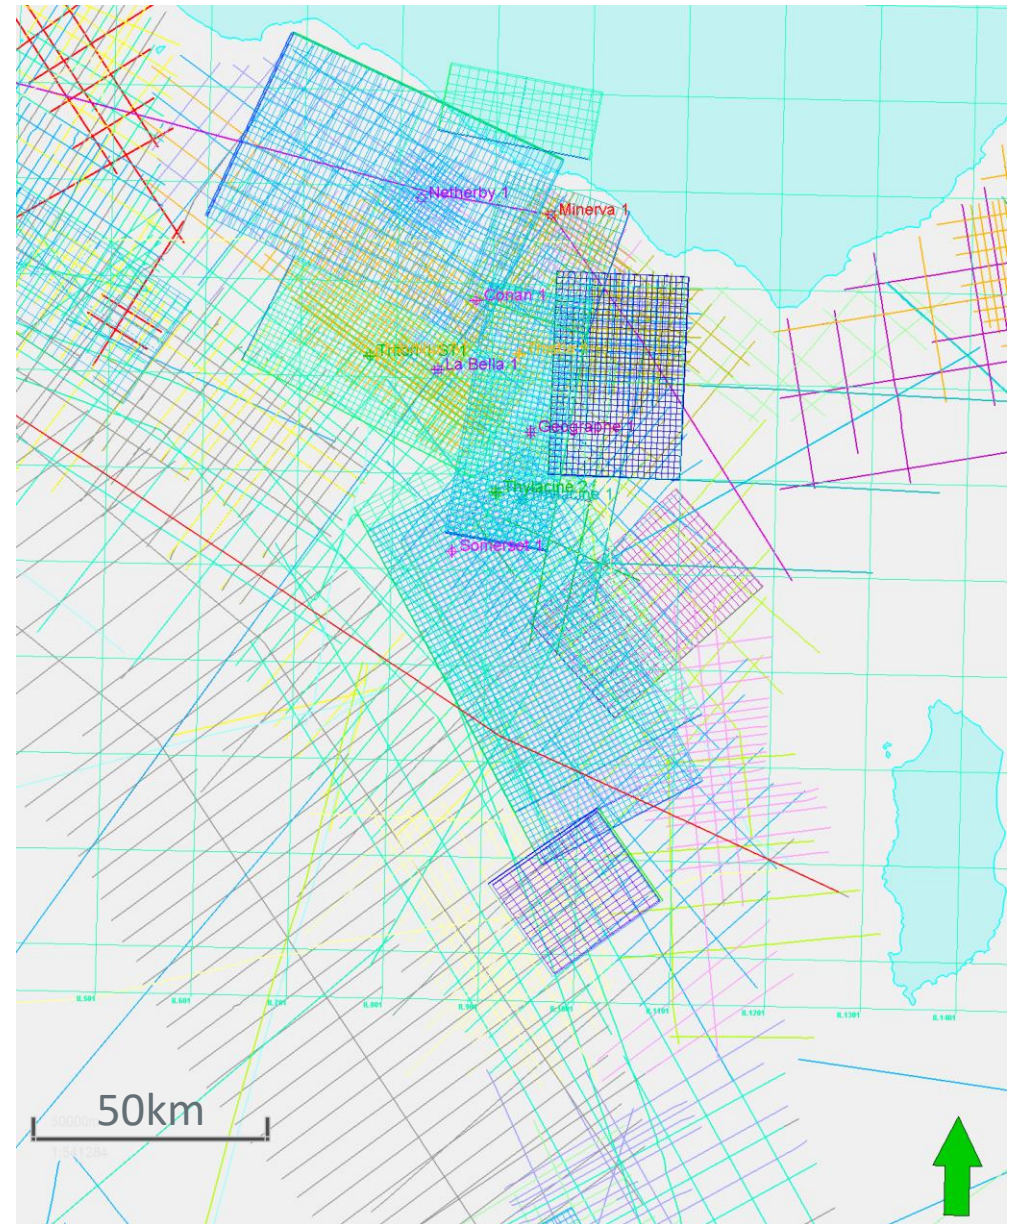

Setting

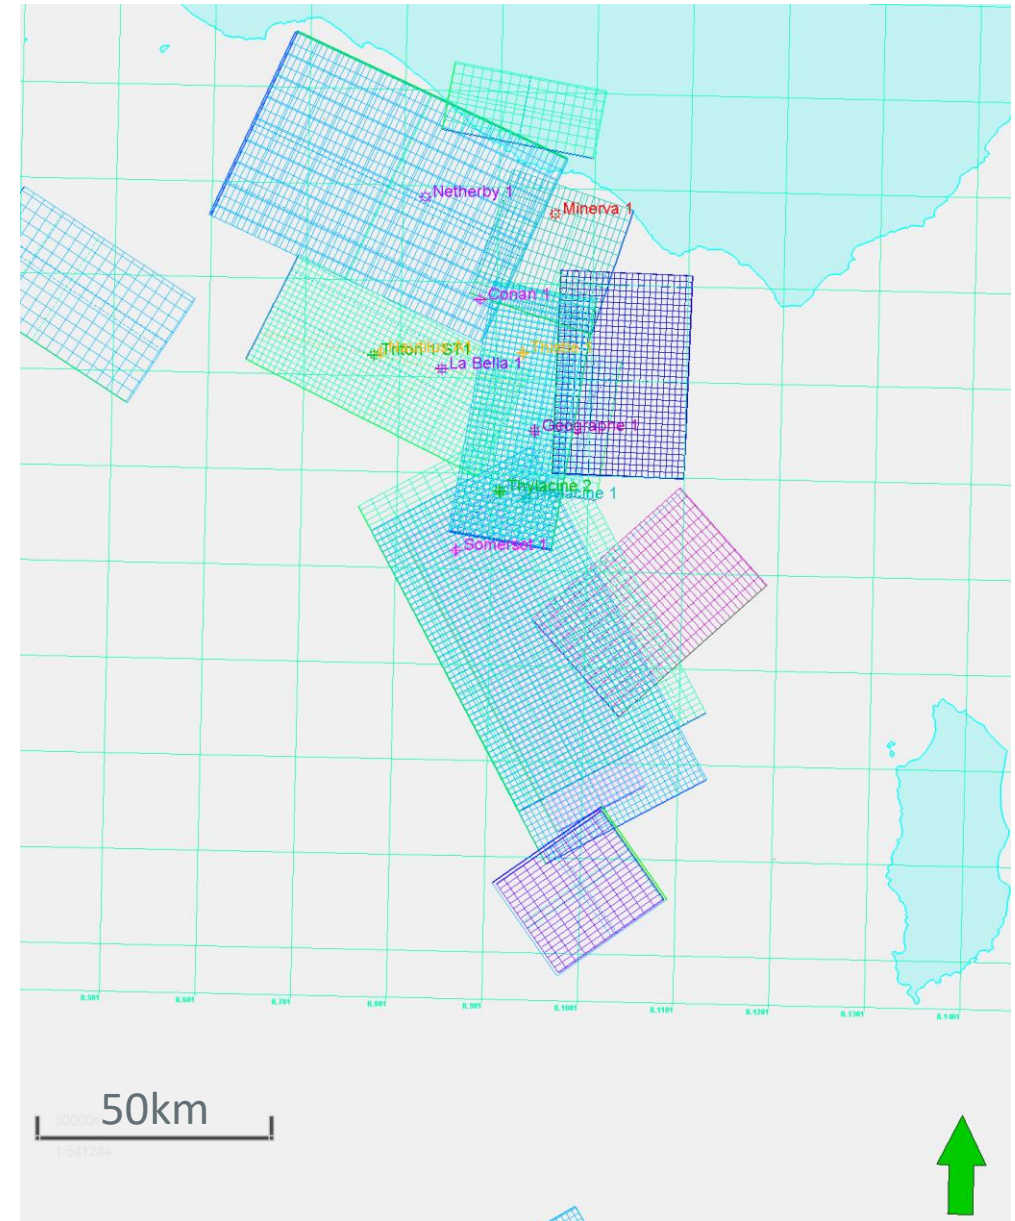

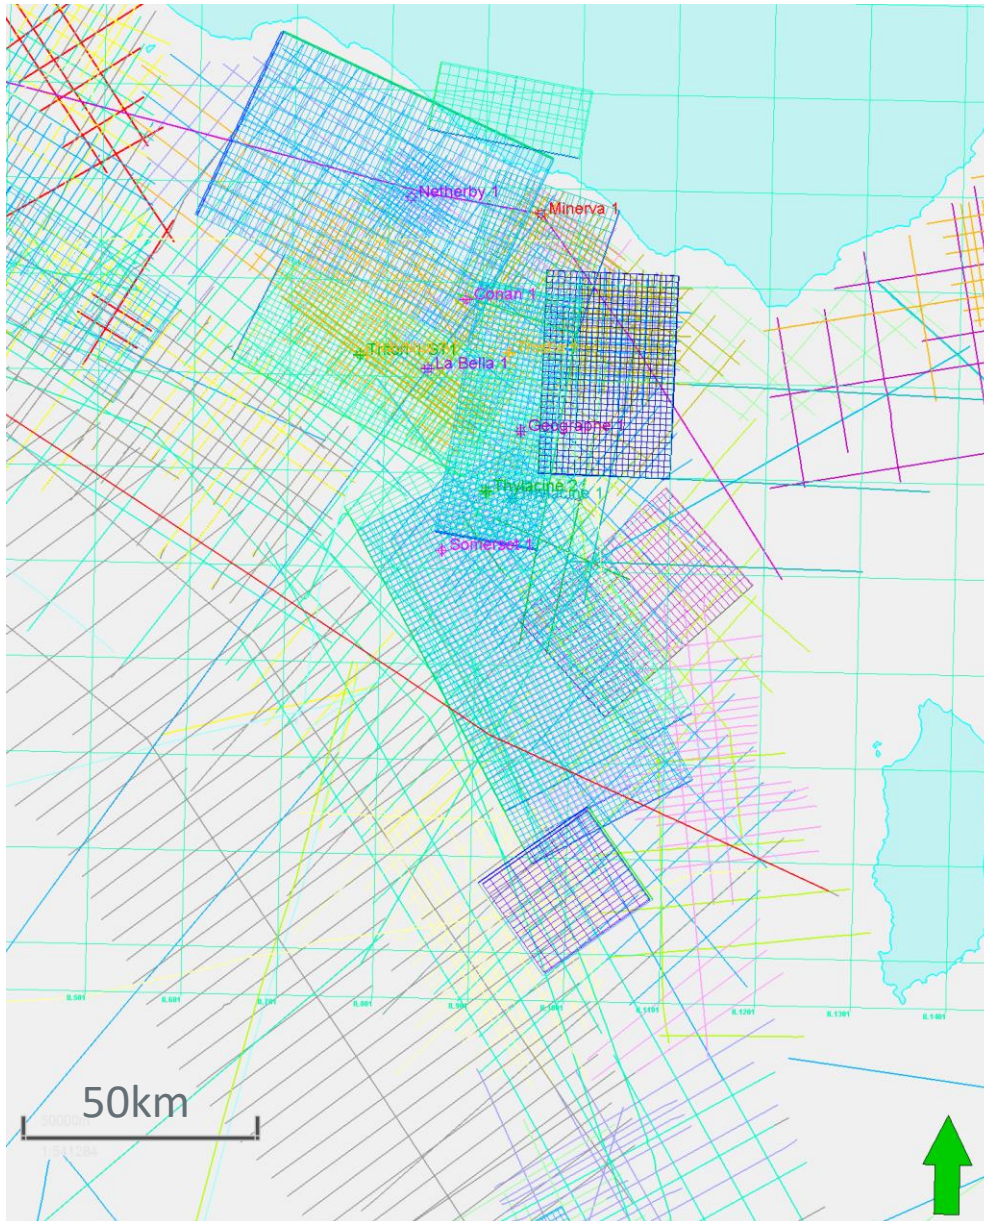

- Multiple surveys, orientation, imaging, previous merges.
- Regional – predominantly 2D - mapping project
- Integrating interpretation across the region – focus on the upper Cretaceous (Sherbrook and Shipwreck supersequences)

Purpose

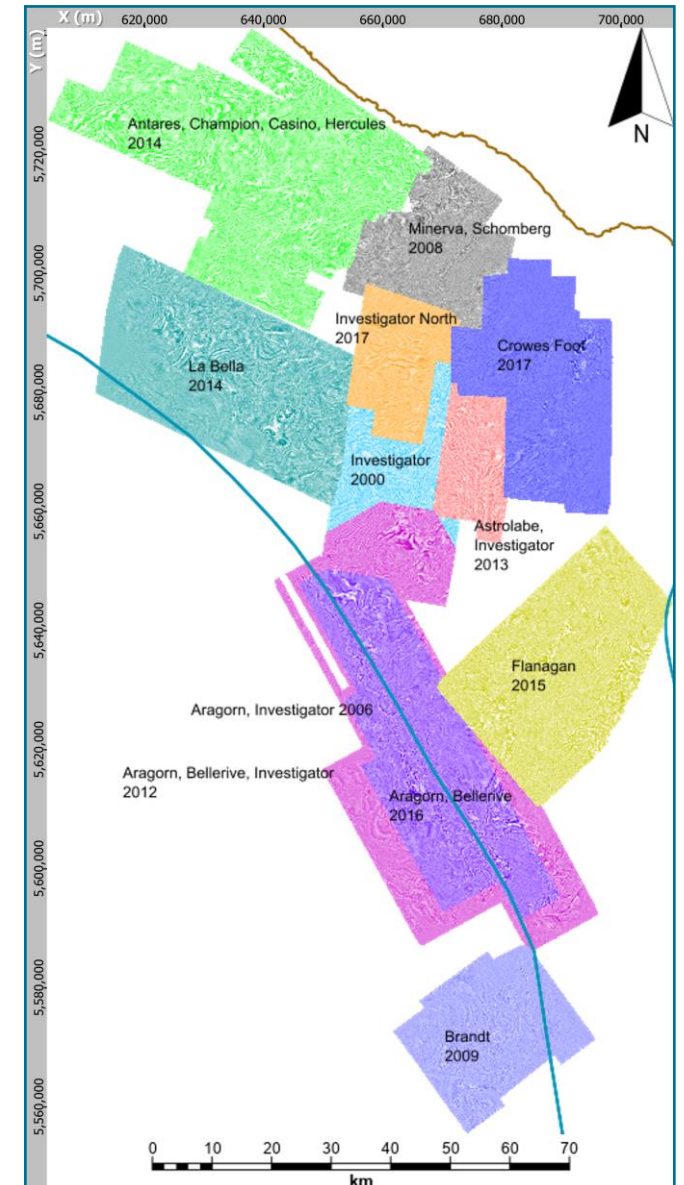

Reasons for post-stack merge (rather than a pre-stack)

- Time
 - Money
 - But mostly time.
- This case was to produce a regularised and seamless single 3D dataset of the highest possible quality, for the offshore Otway Basin, within two-months.
 - Input volumes (12 volumes, 14 surveys) totalling 8,092 km² were post-stack merged and processed to produce a continuous and consistent volume, enabling more efficient and effective interpretation of the region.

Inputs

Volume	Survey(s)	Data type	Angle range	Contractor	Year processed	Input Area (sqkm)
1	Antares, Champion, Casino, Hercules	PSDM stack	0-35°	CGG	2014	1555
2	Astrolabe, Investigator	PSDM stack	3-35°	CGG	2013	506
3	Aragorn, Bellerive, Investigator	PSDM stack	unknown	DUG	2012	1865
4	Aragorn, Bellerive	QKDM stack	5-35°	SLB	2016	1154
5	Aragorn, Investigator	PreSTM Stack	Full offset	PGS	2006	1409
6	Brandt	PSDM stack	5-35°	CGG	2009	608
7	Crowes Foot	QKDM stack	5-35°	SLB	2017	877
8	Flanagan	PSTM stack	2-30°	DUG	2015	974
9	Investigator	Post-stack OMEGA-X migration	Full offset	Veritas DGC	2000	1047
10	Investigator North	QKDM stack	5-35°	SLB	2017	334
11	La Bella	PSTM stack	0-30°	CGG	2014	1333
12	Minerva, Schomberg	PSTM stack	3-40°	Fugro	2008	552

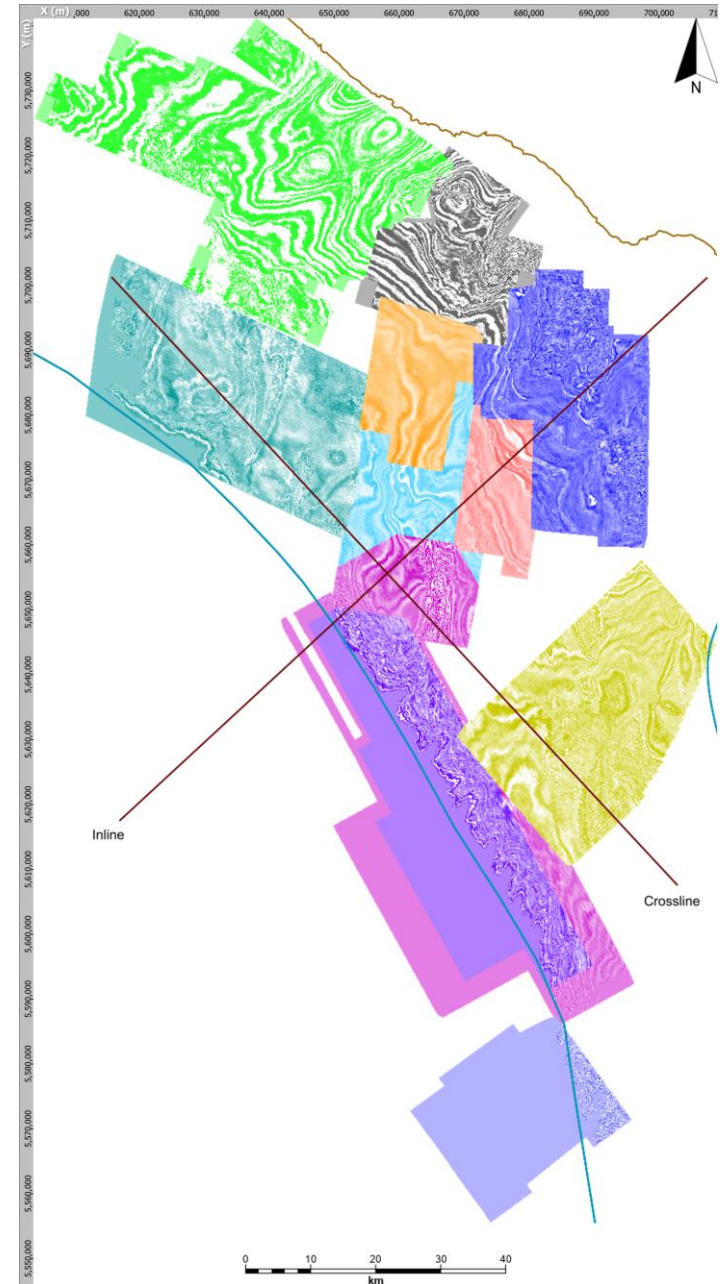

Inputs

Processing

Survey Regularisation and Interpolation
Common grid – orientated to structure

Processing

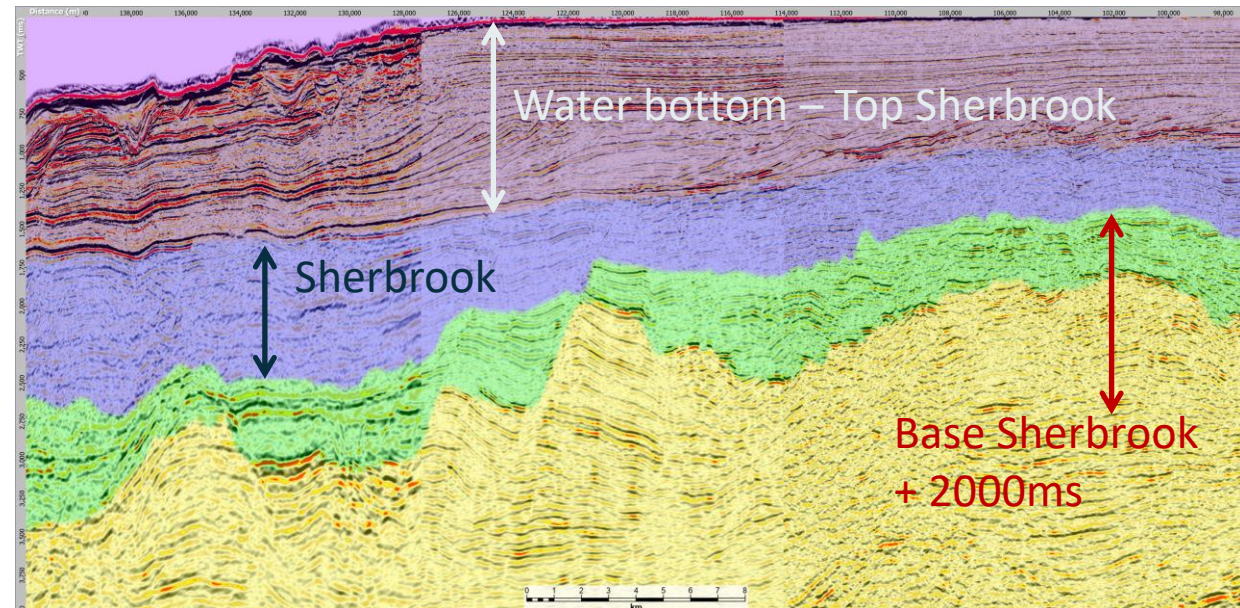

Survey matching – amplitude, phase, time
 using DUG's mis-tie analysis algorithm
 Water bottom+250ms to Water bottom+2500ms

Survey(s)	Time shift	Phase shift	Amplitude scaling
Investigator North	Reference survey		
Antares, Champion, Casino, Hercules	3.47ms	57.16°	1.151x10 ⁻⁵
La Bella	4.48ms	62.36°	2.254x10 ⁻⁸
Minerva, Schomberg	8.55ms	27.56°	8.16x10 ⁻⁴
Investigator	3.52ms	27.39°	0.826
Crowes Foot	4.49ms	42.45°	1.3154
Astrolabe, Investigator	6.53ms	67.87°	1.571x10 ⁻⁵
Aragorn, Bellerive	3.4ms	22.35°	5.425x10 ⁻⁴
Aragorn, Bellerive, Investigator	12.48ms	17.39°	5.942x10 ⁻⁴
Flanagan	6.53ms	57.85°	8.532x10 ⁻⁴
Brandt	20ms	42.84°	1.544x10 ⁻⁵

Processing

Spectral matching

Conclusions

The resultant volume enables;

- more continuous tracking of events using auto trackers, including waveform picking
- production of normalised amplitude maps and extraction of seismic attributes to map extents of geological features across survey boundaries
- faster interpretation of structure and events using contiguous time slices and generation of similarity/variance attributes
- better delineation of structure through better imaging of fault blocks and readily recognising changes in fault trend
- Improved work processes including loading, data management, surface generation...

When should you do a post-stack 3D merge?

Technical

Contiguous/abutting 3D's with variable;

- orientation
- imaging

When constrained by

- Time
- Money
- Access to field data

such that a pre-stack option is not feasible

When pre-stack reprocessing

To provide an 'early' product in parallel

- Where sufficient time and money are available
 - Fast track interpretation
 - Improved model building
 - Targeting issues e.g. de-multiples, velocity problems, noise
