Table S1. Mean concentrations of P fractions (all in mg P kg<sup>-1</sup>) in bulk soil and the change in the P fraction, and total P depletion in the rhizosphere relative to bulk soil ( $\Delta P$ ) for green manure plant species grown in the pumice and volcanic ash soils after 40 days. Values for  $\Delta P$  represent the estimated marginal mean (via the two-way linear model) and its standard error in parentheses; values are bolded when the 95% confidence interval excludes zero; positive and negative  $\Delta P$  indicate rhizosphere P accumulation and depletion, respectively. Bolded values denote cases where the difference in P concentrations between the bulk soil and the rhizosphere soil is significant according to the 95% CI. Ef = early flowering; Lf = late flowering.

P fractions		Pumice					Volcanic ash				
		Ef-lupin	Lf-lupin	Pea	Chickpea	Buck-wheat	Ef-lupin	Lf-lupin	Pea	Chickpea	Buck-wheat
